Q1. Array, 1, 1.5, false, nil

Q2. Everything is object in Ruby that makes codes easy to read. (Actually I do not like Rudy, It looks like scheme!)

Q3. Yes. Because know which part is importance of project so that developers can focus on that part and make sure test that part well is better than general test all parts. Also help others such as customers understand main part make the program easy to use.

Q4. It helps developers, QAs and customers to read the codes. But it adds coding time for coders.

Q5. Advantage is that it makes code easier to read by anyone, disadvantage is need more codes to "explain" it to computer which need to spend more coding time.
